

## Rega RB78

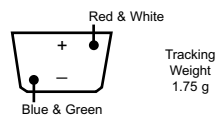

### Using Your Cartridge

This mono cartridge is wired internally in series and should be connected in one of the following ways.

**Amplifier has a mono switch:**  
Take either the red and green or the white and blue cartridge tags and fix as illustrated.

**If your amplifier does not have a mono switch:** The two channel signals and the two earths need to be joined together. This can be done either by soldering the cartridge tag wires together or by joining together at the Phono end of the tonearm cable, with both methods giving the following fixing to cartridge.

**Please note:** Rega have not tried to create a false impression of expense by using an elaborate package. We have used the most simple and cheap carton possible to avoid transit damage and therefore more is actually spent on the cartridge itself and you get better value.

**Stylus guard:** Remove location tags for use on installed cartridge.
